

T7 Test Report – Browse & Detail

Sep 27, 2026 · Matthew Kwong

Summary

53 test scenarios are written for the Browse and Detail screens. On 27 Sep 2026, 25 of them were checked against the current build by reviewing its code: 1 passed, 8 failed and 16 are not built yet. The other 28 need someone to use the app in a browser, and are still "Not tested" because the ticket data can't be loaded yet (see Test environment).

Scope: Story 1 (Browse ticket list) and Story 2 (Ticket detail view), from the Week 1 user stories and acceptance criteria. Story 3 (Checkout) is out of scope for T7.

Approach: Each scenario traces to one acceptance criterion or testing-checklist item. It is written as Given / When / Then and covers happy path, edge cases, empty states, responsive layouts, interactions and accessibility. The full scenario list is in the T7 spreadsheet (Test Scenarios tab).

Test environment: Build: GitHub branch *feature/browseTicketListAndDetails*, commit 393d27e. Tested 27 Sep 2026 by reviewing the code for the Browse page and the ticket detail pop-up, and one on-screen check of B-01. Browser testing is blocked for now: the app shows "Missing or insufficient permissions" when loading tickets, because the updated Firestore security rules haven't been published to the team's Firebase project. Browsers and devices: to fill in once browser testing is done.

Results

Counts from the spreadsheet's Summary tab. D-26 covers both screens and is counted under Detail.

Screen	Scenarios	Pass	Fail	Blocked	Not built	Not tested
Browse (Story 1)	25	1	5	0	8	11
Detail (Story 2)	28	0	3	0	8	17
Total	53	1	8	0	16	28

Gap ID	Title	Scenario	Steps to reproduce	Expected	Actual	Severity	Device / browser	Status
--------	-------	----------	--------------------	----------	--------	----------	------------------	--------

Overall status: Not ready for sign-off. The basic flow is built: all tickets show on one screen, a details pop-up shows includes and excludes, and there's an error message with a Retry button. However, 13 gaps are logged, 3 of them High severity (G-04, G-10, G-11), and 28 scenarios still need testing in a browser.

Key findings:

- **G-04 (High): Sold-out and low-stock states are not built.** Tickets have no stock information, so "Sold out", "Only X left" and "sold out while viewing" can't happen. This affects 6 scenarios (B-14 to B-17, D-23, D-24).
- **G-11 (High): There is no cart.** The detail pop-up has "Add to selection", which adds the ticket to a side panel on the page. There's no cart count or confirmation message (D-10, D-11).
- **G-10 (High): No zone map or seat description.** The detail pop-up shows only the zone name (D-04, D-05, D-20).
- **G-02 and G-09 (Medium): Order and dates.** Tickets are sorted A–Z by name instead of by price (B-04), and the detail shows day names ("Thu, Fri, Sat, Sun") instead of actual dates (D-03).
- **G-01 (Medium): Cards are missing the tier badge and view quality indicator** required by the card acceptance criterion (B-02).

Gap log

Log every scenario that fails or isn't built, so a developer can reproduce and fix it without asking you. Put the Gap ID back on the scenario row in the spreadsheet.

A good gap entry has: a clear title, the scenario ID it came from, exact steps to reproduce, expected vs actual result, a screenshot, and the device or browser used.

Severity guide:

- **Critical:** blocks the user from continuing, e.g. can't open a ticket or add it to the cart.
- **High:** breaks an acceptance criterion in a way users will notice, e.g. a sold-out ticket can still be bought.
- **Medium:** partly meets the criterion or has a workaround, e.g. the low-stock label shows the wrong number.
- **Low:** cosmetic, e.g. spacing or font weight is off from the style guide.

All gaps below were found by reviewing the code (commit 393d27e). Screenshots will be added when each gap is confirmed in a browser.

G-01	Card missing tier badge and view quality indicator	B-02	1. Sign in and open Browse tickets. 2. Look at any ticket card.	Card shows tier badge/label, price, zone, view quality indicator and days covered	Card has no tier badge or view quality indicator; the ticket data has no fields for them	Medium	Code review	Open
G-02	Tickets sorted alphabetically, not by price	B-04	1. Open Browse tickets. 2. Compare the card order with the prices.	Ordered by price (or the agreed recommended order)	Sorted A–Z by ticket name	Medium	Code review	Open
G-03	No card hover state and no active state on buttons	B-11, B-12	1. Open Browse on desktop. 2. Hover over a card. 3. Click and hold a button.	Card hover state; visible active state on click	Only buttons change on hover; no pressed/active style	Low	Code review	Open
G-04	Sold-out and low-stock states not built	B-14, B-15, B-16, B-17, D-23, D-24	1. Try to set a ticket tier to 0 or 5 tickets left. 2. Open Browse and the ticket's details.	Sold-out cards labelled and disabled; "Only X left" label; sold-out banner on detail	Tickets have no stock information, so none of these states can happen	High	Code review	Open
G-05	Price ranges not supported	B-18	1. Try to give one ticket type two prices (\$450 and \$550).	Card shows a range, e.g. "\$450–\$550"	Each ticket type can only have one price	Medium	Code review	Open
G-06	Empty state wording differs and has no FAQ/waitlist link	B-19, B-20	1. Remove all ticket types from the database. 2. Open Browse	"All tickets are currently sold out. Check back later" with an FAQ or waitlist link	"No tickets available. Please check back soon for available ticket types." with no link	Low	Code review	Open

			tickets.					
G-07	Spinner instead of skeleton loaders	B-21	1. Set network to Slow 3G in browser dev tools. 2. Open Browse tickets.	A skeleton placeholder for each card	One spinner with "Loading tickets..."	Low	Code review	Open
G-08	Buttons smaller than the 44px minimum	B-25	1. Open Browse at 375px wide. 2. Measure a button's height in dev tools.	Buttons at least 44px tall and wide	Buttons are about 38px tall; the close (X) button is about 38px square	Medium	Code review	Open
G-09	Detail shows day names, not actual dates	D-03	1. Open Browse tickets. 2. Click "View details" on a 4-day ticket.	Actual dates, e.g. Fri 13 – Sun 15 March	Shows "Thu, Fri, Sat, Sun"	Medium	Code review	Open
G-10	No seat description or zone map	D-04, D-05, D-20	1. Open any ticket's details.	Zone name and seat description; zone map with alt text, or "Zone map not available"	Only the zone name is shown	High	Code review	Open
G-11	No cart: "Add to selection" instead of Add to cart	D-10, D-11	1. Open a ticket's details. 2. Click the green button twice.	Cart count goes from 0 to 1 with a confirmation message; agreed rule for a second click (Q-07)	Ticket is added to a side panel on the page; a second click removes it. No cart or confirmation	High	Code review	Open
G-12	Detail has no web address; back button and refresh not handled	D-13, D-28	1. Go from Dashboard to Browse tickets. 2. Open a ticket's details.	Back returns to Browse at the same position; refresh or a direct link shows the same ticket or a sensible fallback	Back leaves Browse and goes to the Dashboard; refresh closes the details; details can't be linked to	Low	Code review	Open

			3. Press the browser back button, or refresh.					
G-13	No restriction warning	D-22	1. Try to give a ticket a restriction (e.g. 18+ only). 2. Open its details.	Restriction shown in a clearly visible warning box	Tickets have no restriction information, so nothing is shown	Medium	Code review	Open

Open questions on the acceptance criteria

ID	Question	Affects	Answer
Q-02	Low stock is "under 20". Does exactly 20 show the label, and is the wording "Only X left"?	B-16, B-17	Not implemented
Q-03	Should type and price be "unchanging" as in sticky while scrolling, or just a fixed value?	D-02	Not implemented
Q-04	Desktop should show all sections without scrolling, but 10+ item lists are allowed. Which wins?	D-16, D-21	Not implemented
Q-05	Does the card button "enlarge" info in a pop-up on Browse, or go to the Detail screen?	B-03, D-01	Implemented
Q-06	If a ticket sells out while viewing, does the page update live or only on Add to cart?	D-23	Availability should be re-checked when the user clicks Add to cart. If the ticket has sold out since the page loaded, the add should fail and the page should update to show Sold out.
Q-07	There's no quantity selector on Detail. What happens if Add to cart is clicked twice?	D-11	"Clicking Add to cart twice should increase the quantity of the existing cart item rather than create a duplicate line item, subject to any purchase limit

Q-08	What is the "recommended order" for tickets: price low to high, high to low, or something else?	B-04	"Recommended order" should be defined by the product/design team. If two tickets have the same recommendation priority, use price ascending as the default tie-breaker.
Q-09	Is the empty-state link to the FAQ or a waitlist, and where does it point?	B-20	The empty-state link should point to a waitlist/availability notification option rather than a general FAQ, since that is more directly useful when no tickets are available.
Q-10	What should happen with the browser back button, a page refresh, or a direct link to a detail page?	D-13, D-28	Browser back should return the user to their previous page/state where possible. Refreshing or directly opening a valid detail URL should load that ticket normally; an invalid/non-existent ticket URL should show a clear not-found state rather than break the page.

These 10 points are unclear or conflict in the criteria, so the affected scenarios have no fixed expected result yet. Get answers from the team or product owner before testing those scenarios.

Sign-off: Tested by Kar Wei Kwong (BA). Reviewed by: Blake Leo (Dev). Date: 27/9/2026.
